Greenfield Local Hub Design Documents

- The following documents will provide a clear and definitive conceptual depiction of the initial design phase.
- Alongside the:
  - Mood-board
  - Wireframe Designs
  - Page Navigation logic
  - Algorithm Designs
  - Test Strategy.

Wireframe Designs

- The following slides contain the initial layout design for each page of the website.
- Followed by annotations of the wireframe designs and page navigation.

Marquee positioned at the top of the page to draw attention towards it, displaying important details such as discounts or updates so users can remain informed.

Account and order management buttons situated at the top of the page to ensure it is always accessible for the user.

A title and subheading to describe what is on the page to the user in greater detail then an initial visual depiction.

Large banner image at the top of the page to immediately represent which page the user is on at a glance when first viewing the page.

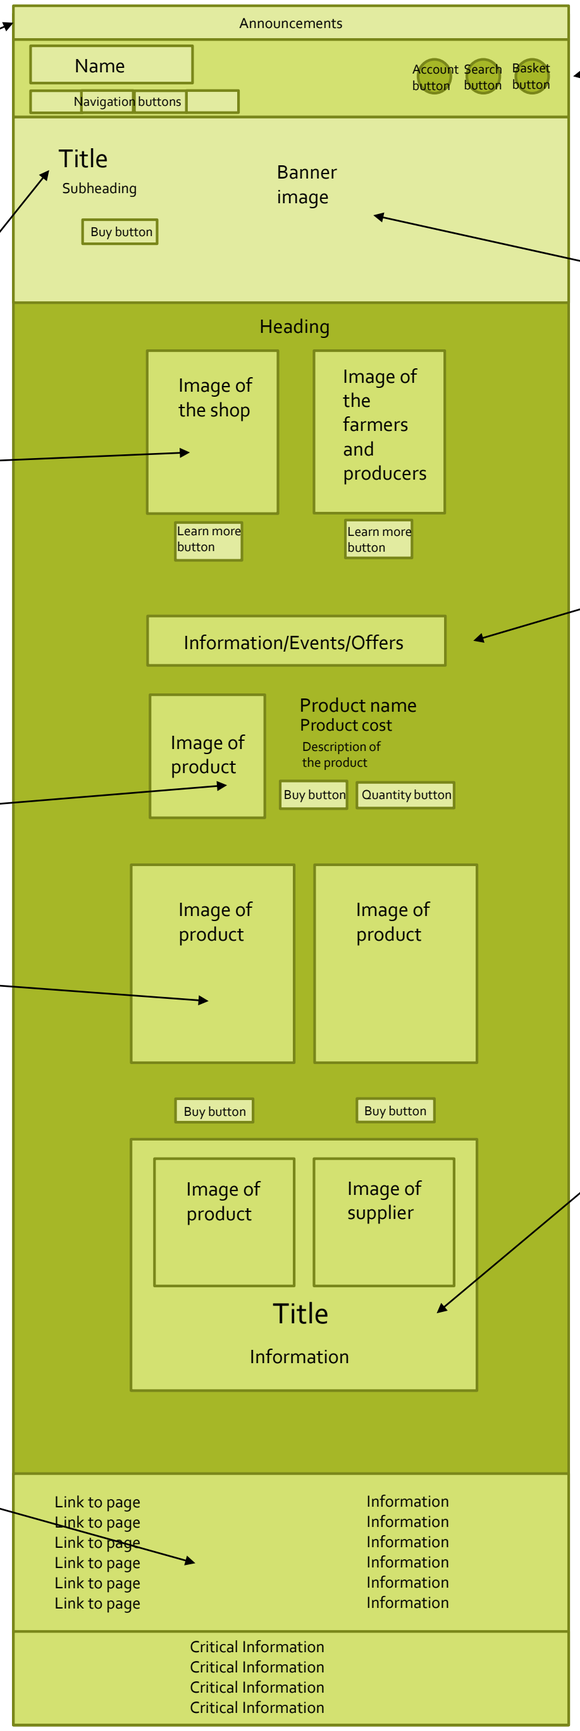
Sections dedicated to displaying information about the shop store and the farmers and producers that supply it meets the clients needs by spreading awareness of their providers.

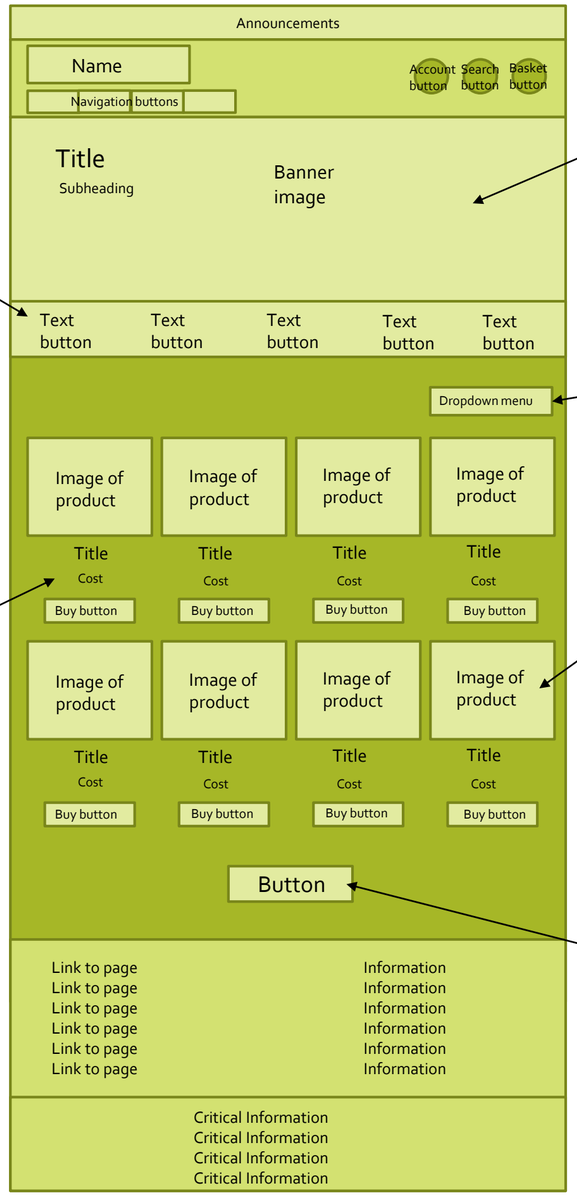
An announcement and information section in the middle of the page will capture the attention of users as it contrasts the other content on the page.

Placing a product listing on the main page of the website will give the impression that this product is important and pressures the user into purchasing it, while also giving the user an example of the types of products the website offers.

Displaying information about an example producer and their product to the user will make the website appear more personal instead of corporate as it is directly involved with the suppliers.

Condensing important and useful information in the footer at the bottom of the page allows users to intuitively find and use it while being a prime location for any necessary but unappealing elements such as terms and conditions or contact information.





Adding buttons to change which types of items are shown will allow the user to easily find specific categories of products with a single click.

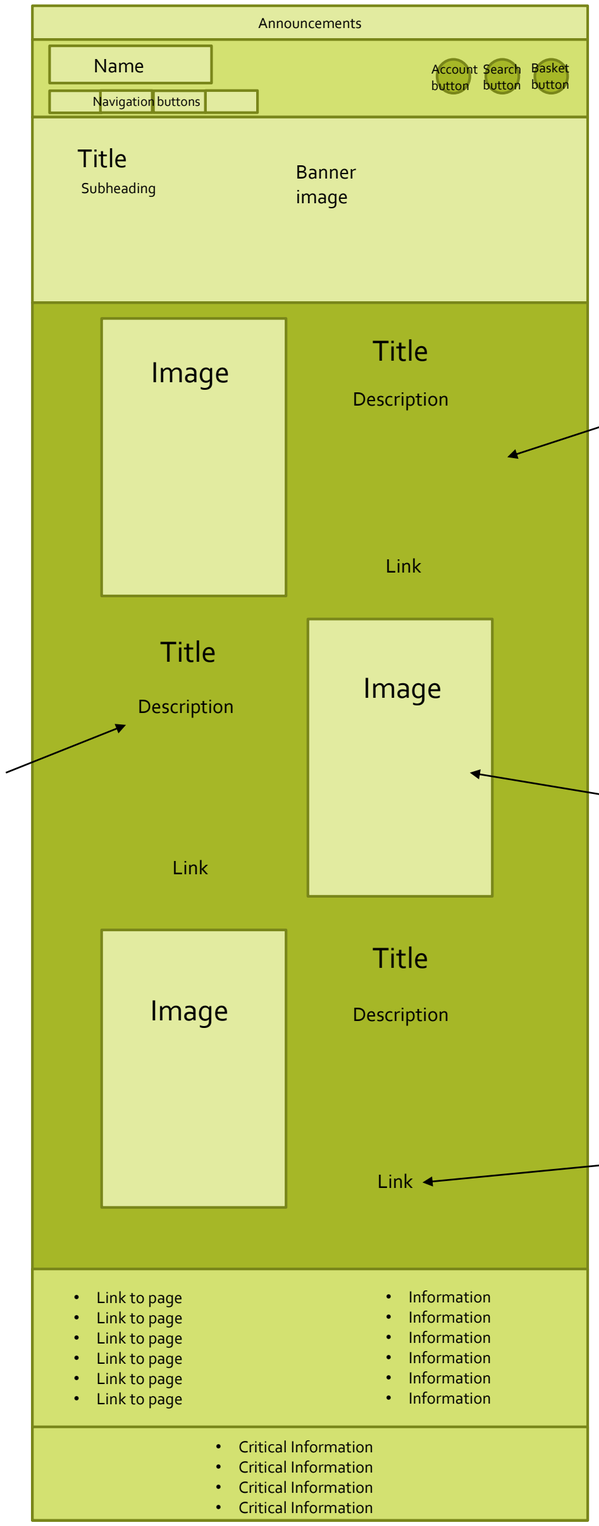
Using a banner image in the shop section of the website will convey the purpose of the page and also set the mood of it, with produce shown.

Using a grid allows for a simple to understand sorting dropdown menu, commonly used in most websites so users will already understand the practical application.

Positioning the cost, Information about the product and the button to buy it under each respective product provides the user a organised and logical layout using visual hierarchy to draw the users attention to each piece of information.

A grid pattern when displaying the products will make the design of the page very structured and organised, translating those feelings to the user when they view the section.

Using a button to load more products when clicked saves the loading time required to initially display a vast range of products, negatively affecting the user experience.

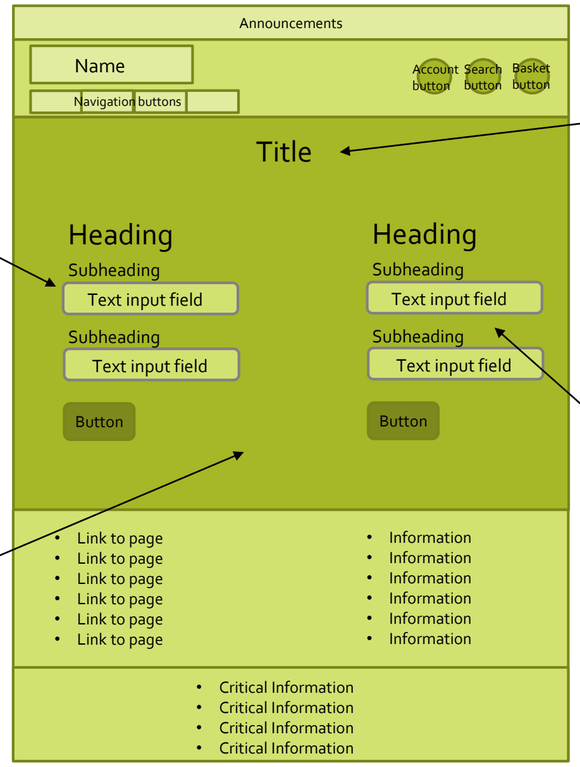


Using an alternating pattern of images and information breaks up the page, making it appear less repetitive while still conveying the information.

A mix of visual imagery and descriptive text will allow users of various types to gleam the information provided.

The images used will be eye catching to users, drawing their attention towards each one, guiding them to the correct information using visual depictions.

Attaching a link below each section allows users to easily carry on from that information to its respective page without needing to find it.

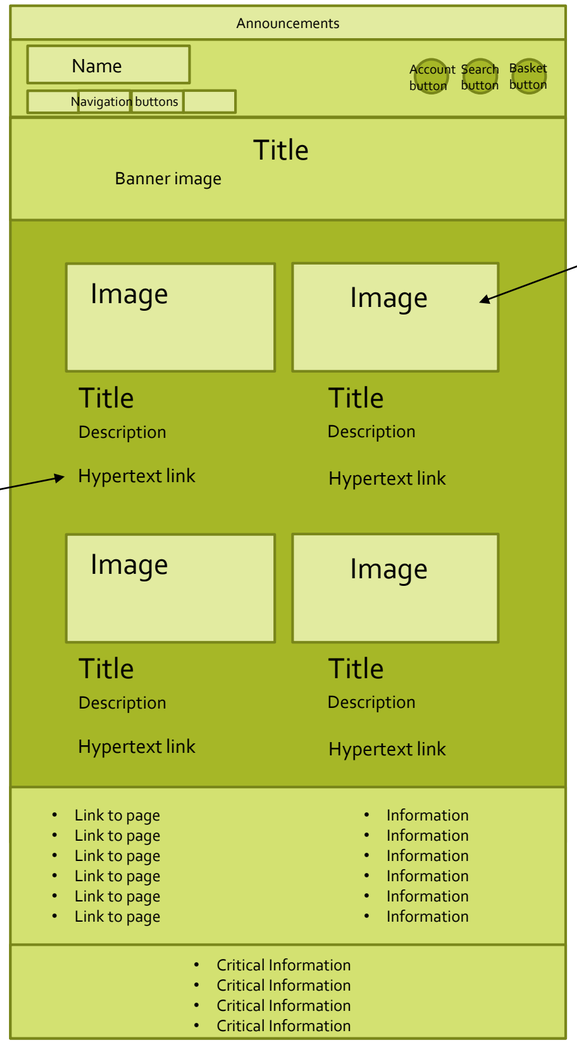


Positioning the login and registration forms side-by-side makes the account process more simplistic for the user, displaying all the options in front of them instead of requiring them to jump through hoops to find a specific page.

A large title at the top of the page is required to inform the user which page they are on, without a banner image.

Requiring both an email and password during the registration process allows the user to easily and securely create an account, making the website appear safer and more robust.

The absence of a banner image is to maintain the feeling of a slick and easy account process, removing clutter and inconvenience for the user.



Providing the users with a picture of each producer will make the products that they purchase feel more personal as they have seen and read about the person who they bought from.

Adding a hyperlink to each producer allows the user to easily navigate to the producers selection of produce, making the transition seamless.

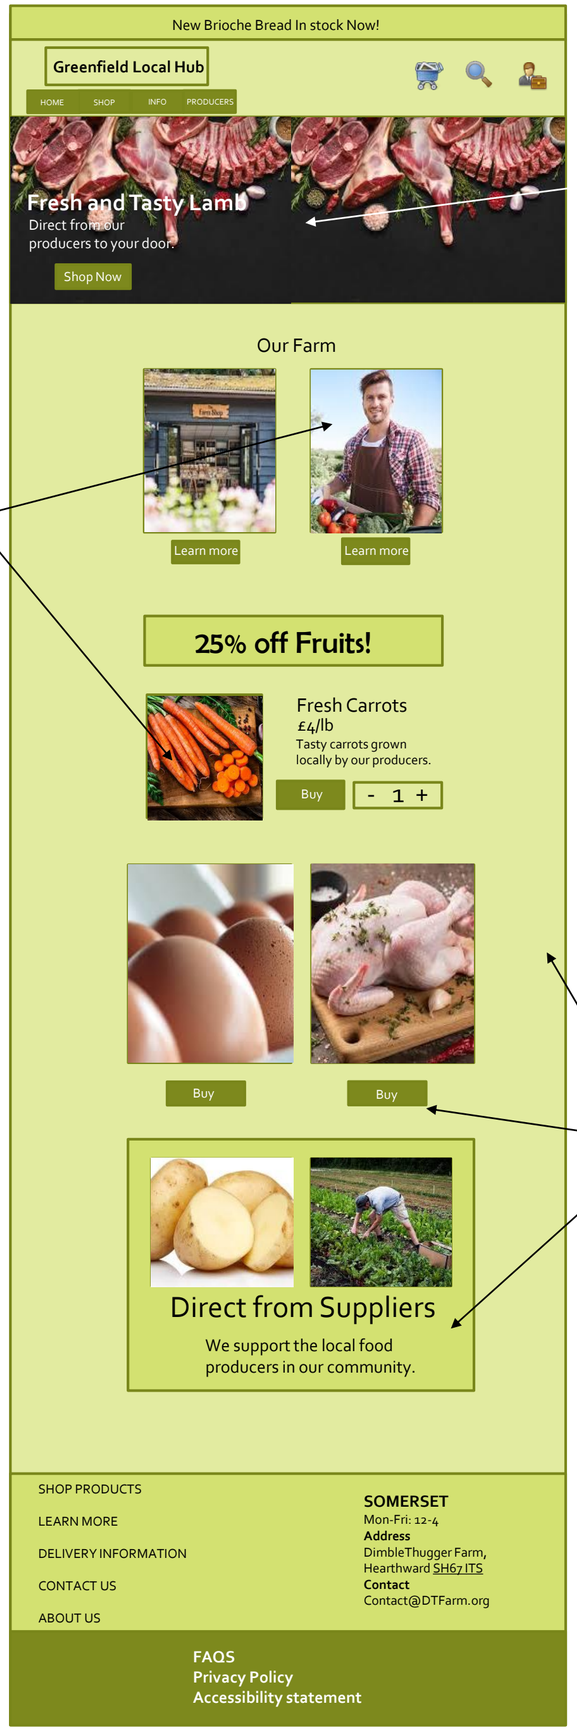
Visual Designs

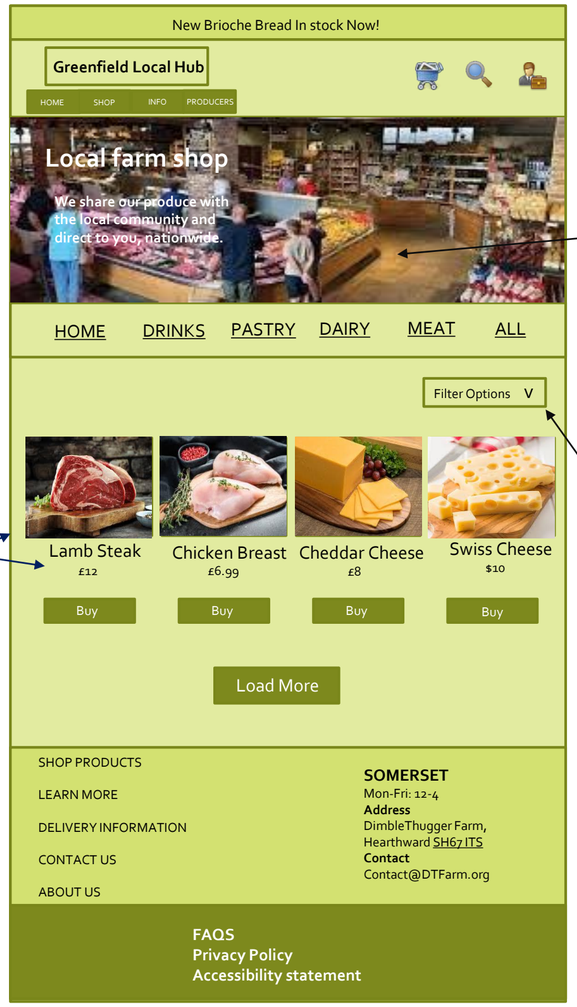
- The following slides contain visual designs for the first iteration of the webpage designs.
- Annotations of design choices, colours and images used.



Using a large banner image displaying stock draws the attention of the user using visual hierarchy while informing the user which page they are on.

Adding bright and vibrant images makes the website appear more friendly, warm and welcoming to customers.

Constant shades of green make the website feel more natural, as if it was part of the farm.



Images of the inside of the shop will immerse the user in the website, making them feel as if they were there, leading to increases in sales as it pressures the user into purchasing.

A way to order and filter through produce will make the user experience better as it prevents tedious searching.

Product information cleanly displayed so it is easier for the user to purchase, improving the user experience.

Pictures and personal information about the producers and animals builds an emotional connection for the customer, making them more likely to purchase produce.

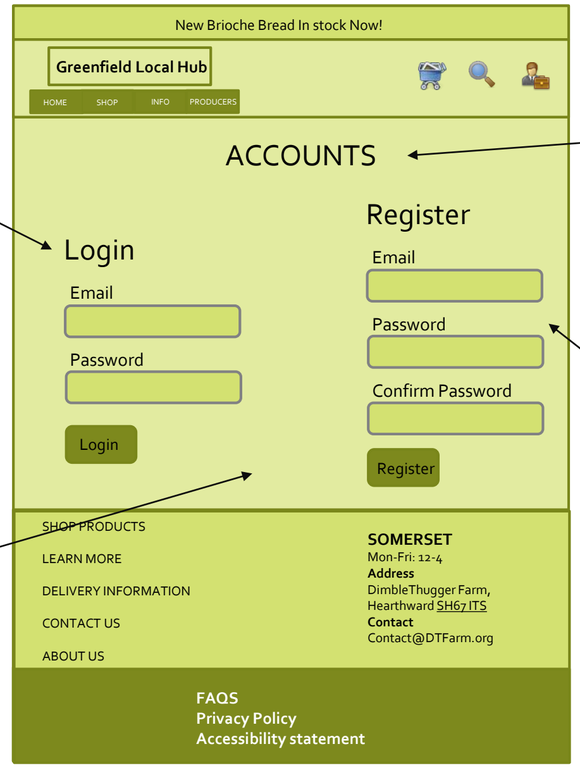
Using an alternating pattern of images and information breaks up the page, making it appear less repetitive while still conveying the information.

A mix of visual imagery and descriptive text will allow users of various types to gleam the information provided.

The images used will be eye catching to users, drawing their attention towards each one, guiding them to the correct information using visual depictions.

Attaching a link below each section allows users to easily carry on from that information to its respective page without needing to find it.

Positioning the login and registration forms side-by-side makes the account process more simplistic for the user, displaying all the options in front of them instead of requiring them to jump through hoops to find a specific page.



A large title at the top of the page is required to inform the user which page they are on, without a banner image.

Requiring password confirmation during the registration process allows the user to easily and securely create an account, making the website appear safer and more robust to the user.

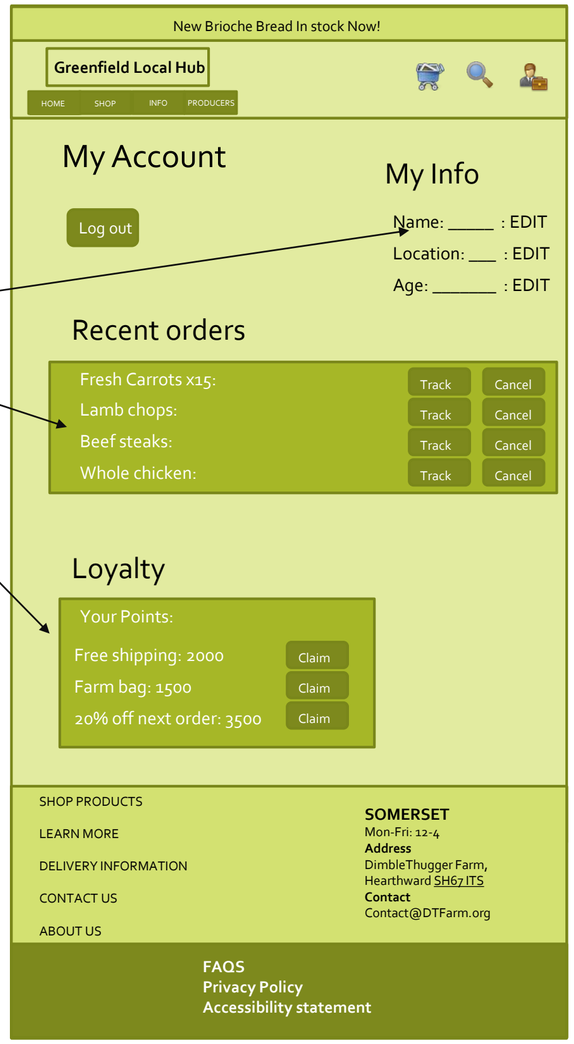
The absence of a banner image is to maintain the feeling of a slick and easy account process, removing clutter and inconvenience for the user.

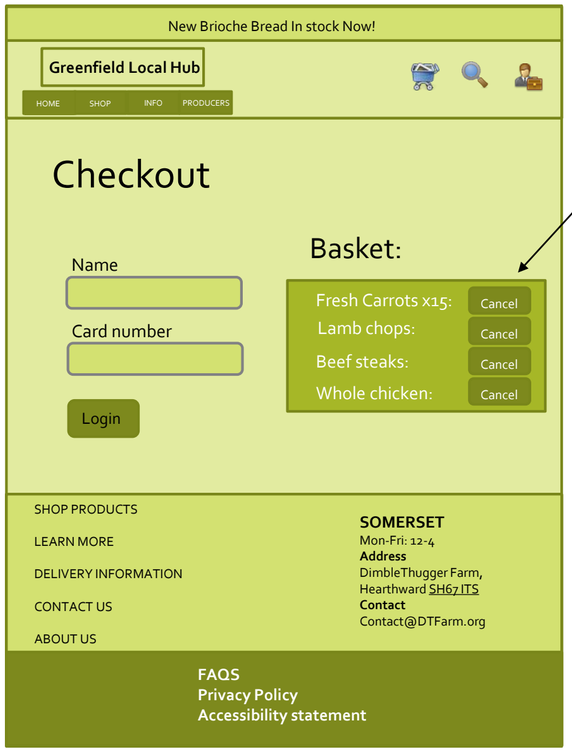
Providing the users with a picture of each producer will make the products that they purchase feel more personal as they have seen and read about the person who they bought from.

Adding a hyperlink to each producer allows the user to easily navigate to the producers selection of produce, making the transition seamless.

Information about each producer displayed for users will build a positive user experience, making the process feel more personal.

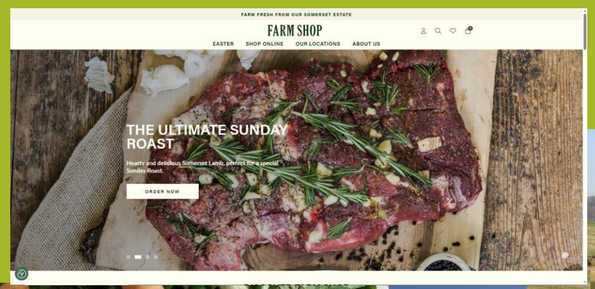
Using a simplistic yet slick style, not adding images and using text to present visual hierarchy will improve the user experience for customers by reducing the confusion and overwhelming amount of content on the account page.

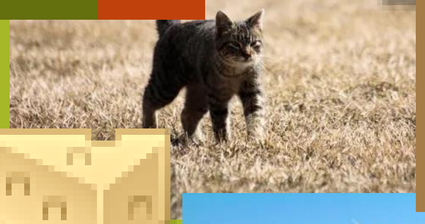


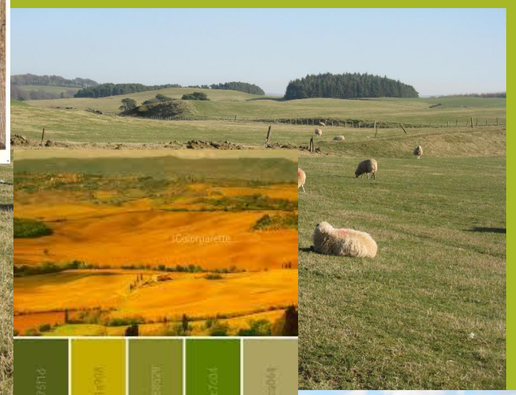


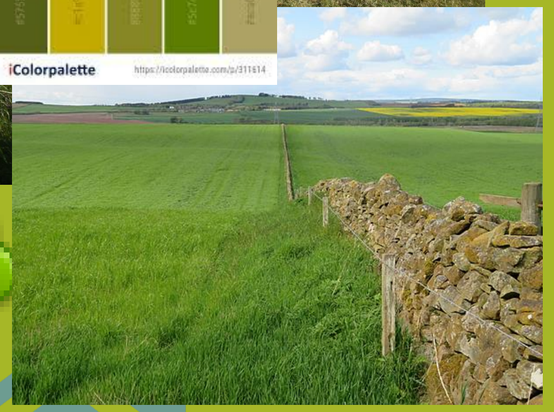
Adding a list of items in the customers basket at checkout will inform them on what they are purchasing.

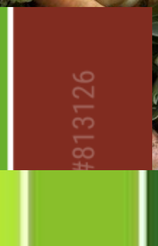
Adamina

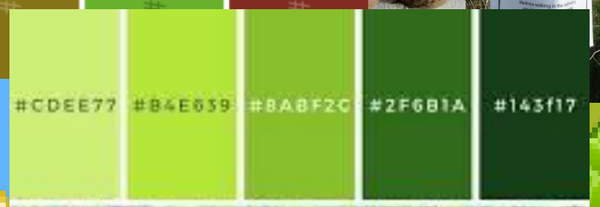












Alfa Slab One

The fonts used should be simple and robotic to represent the industrial style characters on farm equipment, signs and produce.

Pictures of animals, fields and crops should be abundant in the website as it requires a farm-like theme.

Gradients of green, brown and red are commonly representative of nature, farming and soil. These subconscious relation makes the website more appealing and feeling appropriate to the user.

Old styled icons will target the older audience while setting the theme as farmers are represented as being old and reserved from technology, relying on older devices, therefore older styles of icons and images.

An overall green theme makes the website, produce and food appear more fresh, rich and nourishing as the colour green is representative of freshness.
